EDUCATION

SEPTEMBER 2024 – JUNE 2026
MS INFORMATION TECHNOLOGY
Ivane Javakhishvili Tbilisi State University
Focus Areas:
• Data Analysis & Big Data Processing
• System Analysis & Design
• Business Intelligence & Analytics

SEPTEMBER 2020 – JULY 2024
BS ECONOMICS
Ivane Javakhishvili Tbilisi State University
GPA: 3.8 | Specialization: Econometrics & Data Analysis

📄 View Diploma

Beka Razmadze

COLLECTION REPORTING TEAM LEAD

`SELECT leadership, precision FROM collections_reporting WHERE base = 'Tashkent';`

Data Analytics & Collections Reporting Team Lead at TBC Bank Uzbekistan (Space International), based in Tashkent. Started as a Risk Data Analyst, moved into owning C-level executive management reporting end-to-end, and now leading the collections reporting function — building ETL data pipelines, automated reporting and Power BI dashboards, setting KPI and data-quality standards, and mentoring the team. Hands-on with SQL (T-SQL, SQL Server, StarRocks), Python (pandas), Power BI (DAX, Power Query) and Excel, with a background in econometrics and credit-risk, cohort and portfolio analysis in banking and fintech.

WORK EXPERIENCE

Space International — the Fintech Behind TBC Uzbekistan

JANUARY 2024 — PRESENT

CNBC WORLD'S TOP FINTECH COMPANIES 2025 statista · TBC Uzbekistan

//ADASTRA

Collection Reporting Team Lead JUL 2025 – PRESENT 📍 Tashkent, Uzbekistan

Relocated to Tashkent to lead the collections reporting function for TBC Uzbekistan. Designed and built Control Center; leading the migration of the reporting stack from SQL Server to StarRocks, owning the Collection Vintage and Portfolio reports, and leading and mentoring the reporting team.

✈ RELOCATION · TBILISI → TASHKENT · JUL 2025

C-Level Executive Management Reporting Data Analyst JUL 2024 – JUN 2025 📍 Tbilisi, Georgia

Owned end-to-end delivery of executive management reporting — defined what got reported, to whom, and on what schedule. Designed and built an automated daily management reporting tool, and introduced a live Slack status dashboard for report delivery health and data-quality monitoring.

Early Warning System (EWS) COMPLETED DEC 2025 📍 Tbilisi, Georgia · Remote

Partnered with **Nicole Gilberg**, credit-risk consultant, and Adastra to design and build 18 automated fraud and credit-risk detection rules running against the loan portfolio, with weekly Slack alerts and automatic Jira ticketing for triggered rules.

Risk Data Analyst JAN 2024 – JUN 2024 📍 Tbilisi, Georgia

Optimized complex SQL queries (query optimization, indexing), automated daily SSRS reports, and built Power BI dashboards for key credit-risk metrics and KPIs.

Girteka (GBC Georgia)

Internship, SAP ABAP Developer
AUGUST 2023 — DECEMBER 2023 📍 Tbilisi, Georgia

- Developed an SAP Fiori application that enabled customers to access the company's services with a single sign-on

Persati Logistics

Financialist
FEBRUARY 2022 — JULY 2023 📍 Tbilisi, Georgia

- Developed and maintained accurate financial records and documents
- Managed accounts receivable and accounts payable to ensure accurate and timely payment of invoices
- Developed internal financial controls to reduce the risk of fraud and errors
- Prepared and presented financial reports to management and stakeholders, providing insights into performance trends and opportunities

SKILLS

SQL ↗ Python ↗ Data Visualization (Power BI) ↗ Risk Analysis ↗

LANGUAGES & DATABASES

- SQL
- T-SQL
- SQL Server
- StarRocks
- Python
- pandas
- matplotlib
- SAP ABAP

DATA ENGINEERING

- ETL / Data Pipelines
- Data Modeling
- Data Warehousing
- Data Lakehouse
- Data Migration
- Stored Procedures
- Query Optimization
- Report Automation
- Job Scheduling & Monitoring

DOMAIN

- Credit Risk
- Collections Analytics
- Fraud Detection
- Portfolio Risk
- Banking & Fintech
- Financial Analysis
- Financial Controls

BI & REPORTING

- Power BI
- DAX
- Power Query
- Excel
- SSRS
- Dashboard Development
- KPI Reporting
- Executive Reporting
- Data Visualization

ANALYTICS

- Data Analysis
- Statistical Analysis
- Econometrics
- Cohort / Vintage Analysis
- Roll-Rate Analysis
- Root Cause Analysis
- Ad-hoc Analysis
- Data Quality & Validation
- Data Reconciliation

WAYS OF WORKING

- Team Leadership
- Mentoring
- Stakeholder Management
- Cross-functional Collaboration
- Requirements Gathering
- Technical Documentation
- Git
- Jira
- Slack Automation

PROJECTS

REPORTING & ANALYTICS DELIVERED

- **Auto Collection Share Pipeline** — attributes every loan repayment to its collection channel (direct payment, auto-debit, litigation, etc.) across a SQL Server → StarRocks pipeline feeding a live Power BI dashboard and Slack bots.
- **Collections Bonus Calculation** — audited and documented the multi-layer SQL → Power BI pipeline that computes monthly agent bonus payouts, uncovering real calculation bugs.
- **External Agency Recovery Reporting** — built the registry and recurring reporting pipeline tracking loans handed to third-party debt-collection agencies.
- **Early Warning System (EWS)** — partnered with credit-risk consultant Nicole Gilberg and Adastra to build 18 automated fraud and credit-risk detection rules against the loan portfolio, with weekly Slack alerts and automatic Jira ticketing.

Reporting Migration to StarRocks

DATA PLATFORM · 2026

Leading the move of the whole collections reporting stack off legacy SQL Server stored procedures and onto the bank's StarRocks lakehouse. Each report is rebuilt as a StarRocks SQL job, scheduled and health-checked in Control Center, proven equal to the old output, and only then is its Power BI dashboard switched over.

20+
REPORTS & DATA MARTS MOVED

29.5K → 1.1K
LINES IN ONE REWRITTEN REPORT SCRIPT

12h → 15 min
FULL-HISTORY REBUILD OF ONE REPORT

– HOW THE MIGRATION WORKS

`Legacy stored proc` → `StarRocks SQL job` → `Validate vs old output` → `Repoint Power BI` → `Retire old job`

① **Data marts first.** Shared building blocks (call history, CRM contact history, payments, a common product-mapping standard) are migrated before the reports that read them, so every report uses the same definitions.

② **Rewrite, don't copy.** Procedures that ran day by day in loops are rewritten as single set-based passes. One report went from ~29.5K lines to ~1.1K and rebuilds its full history in about 15 minutes.

③ **Prove it matches.** Every new table is compared with the legacy output: row counts, totals per month and product, then loan-level checks for any gap. Differences are either fixed or written down as known, explained source differences.

④ **Gate the refresh.** Power BI refreshes only after Control Center confirms that all upstream source tables are fresh, so dashboards never refresh on stale data.

⑤ **Single source of truth.** A migration status board, trusted-tables registry and contradictions log keep the team aligned on what is live and what is pending.

Collection Vintage Report

COHORT ANALYTICS · POWER BI

Answers one question for management: *"Of the loans that fell into a delinquency bucket in a given month, how much did we recover — and how fast?"* Covers every loan product, with separate views for recovery, litigation and court outcomes.

– REPORT LOGIC

`Daily DPD snapshot` → `Cohort by entry month` → `Track month 1…24` → `Recovery % matrix`

① **Build cohorts (vintages).** Every loan is assigned to the month it first entered a DPD bucket (1+, 31+, 61+, 91+ days past due). The balance at entry is the denominator.

② **Follow each cohort month by month.** For up to 24 months after entry, the report measures how much of the entry balance has left the bucket: cured back to 0 DPD, fully closed, or paid down.

③ **Two ways to count recovery.** *Balance exit* counts a cured loan at its full balance. *Cash recovery* counts only the principal actually paid, capped at the entry balance. A loan that defaults again stays in its first cohort, so payments are never counted twice.

④ **Recovery type breakdown.** Recovery is split into cure, closure, paydown and payment after cure, so a high rate driven by cures is not mistaken for cash collected.

⑤ **Litigation & court vintage.** Litigated loans are cohorted by litigation month and tracked through court stages and closure.

⑥ **Slice everything.** Product, product group, legal entity, client segment and fraud type filters all work on the same matrix.

Rewrote the full report on StarRocks, and found and fixed real logic bugs during the audit: product splits silently collapsing, month-end cohort shifts, and a one-off mass loan-forgiveness event distorting recovery rates.

Portfolio Report

PORTFOLIO RISK · POWER BI

A monthly picture of the whole loan portfolio together with what the collections team did on it: how many loans are overdue, how deep, and how many were contacted, promised to pay, paid, or went to litigation.

– REPORT LOGIC

`Month-end portfolio snapshot` → `+ Collection actions` → `Aggregate by segment` → `Dashboard`

① **Snapshot the portfolio.** Each month, every active loan is captured with its product, DPD bucket, score segment, fraud type, region, write-off and litigation status, and current collection stage.

② **Layer collection activity on top.** For each loan the report adds contact results (right-party / third-party contact), promises to pay, payments, letters sent, and enforcement-bureau and litigation flags.

③ **Aggregate for speed.** Loans sharing the same attributes are grouped into one row with a loan count and summed overdue days, so averages like mean DPD are computed correctly as total overdue days ÷ loans.

④ **Track movement.** New loans, cures and rolls between buckets are flagged by comparing consecutive snapshots.

Diagnosed and fixed real data-accuracy bugs (loans falsely tagged as "new", a litigation flag that didn't persist) and rebuilt the report on StarRocks as a single full-history pass that was proven equal to the old output.

Control Center

INTERNAL WEB TOOL

A control-plane web app I built to schedule and monitor collections reporting infrastructure: gates Power BI dashboard refreshes behind live SQL health checks so nothing refreshes on stale data, runs scheduled jobs that rebuild heavy reporting tables from refill scripts, and posts real-time status to a Slack dashboard with automatic issue tracking when a job fails repeatedly.
