ICL Applications for the Last 24 Hours

Data Update Time: 2024-12-30 17:00:07

Total Applications: 38,172

Total Approved Applications: 8,699

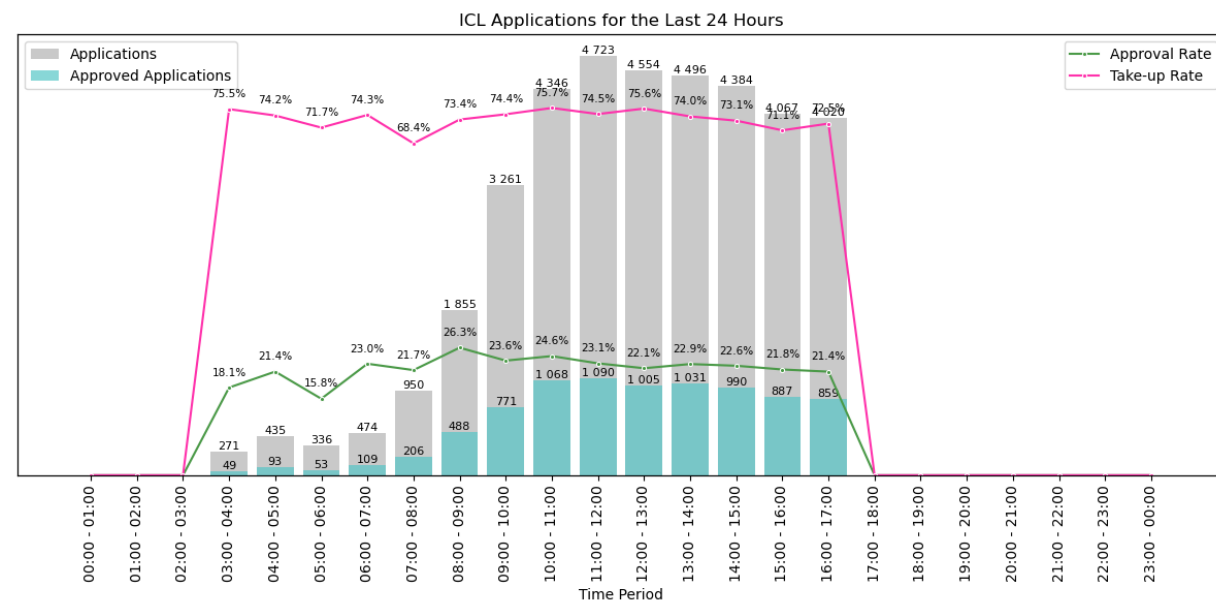

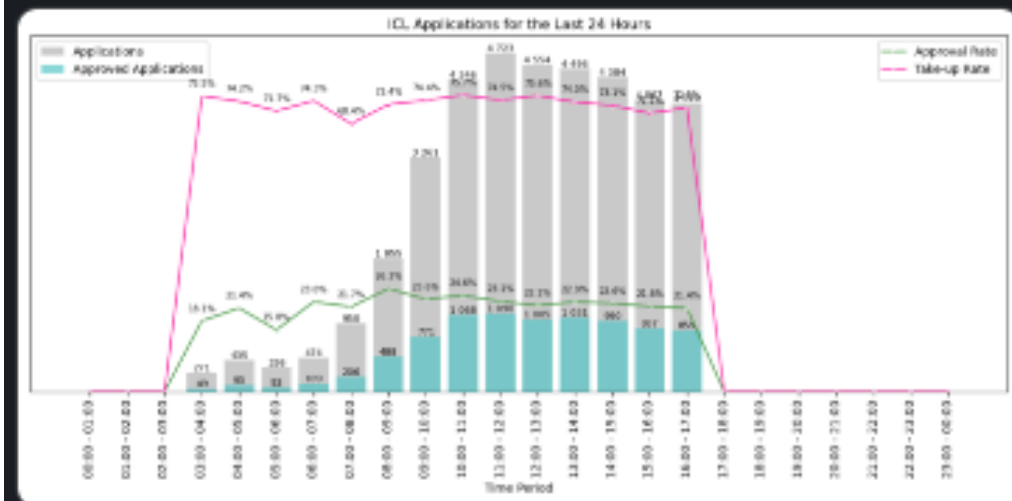

Approval Rate: 22.79%

Total Disbursed Loans: 6,420

Total Disbursed Amount: 69,957.21M

Take-up Rate: 73.80%

Plot ICL ▼

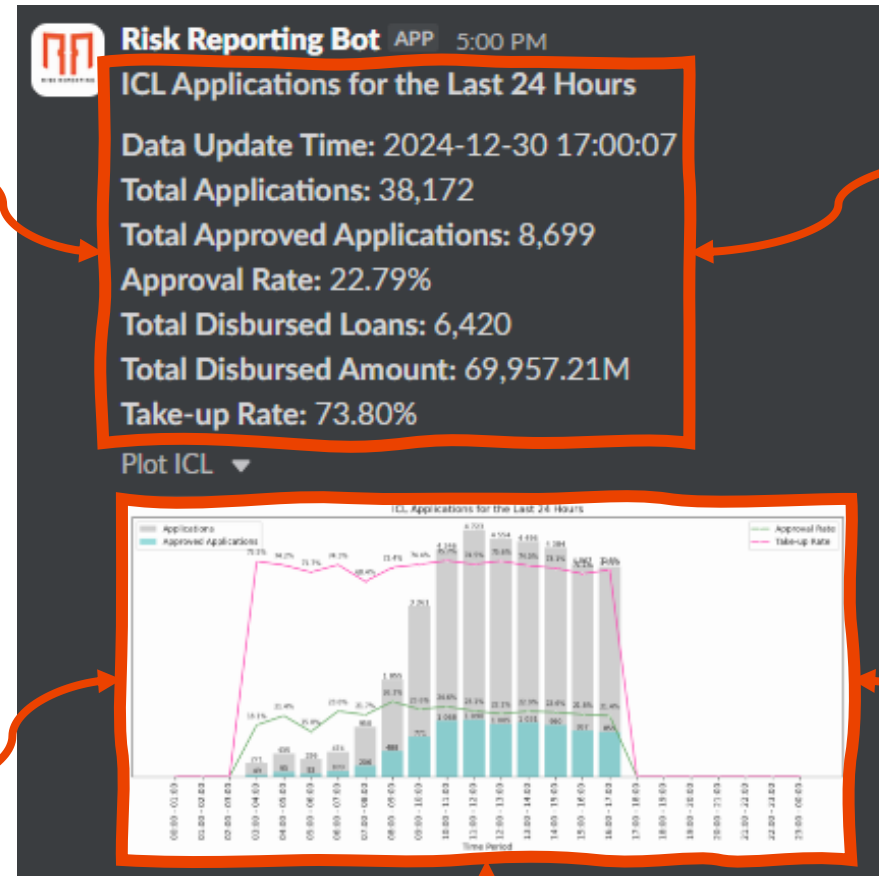

What's the problem?

Too much text → hard to scan

No historical comparison → performance unclear

The chart provides little information; most of the explanation is carried by the text

Weak visual design

Too much visual noise:

- unnecessary borders
- zero-value lines
- cluttered axes

PORTFOLIO & PAR FORECAST

FOR INTERNAL USE ONLY

- **March – July** PAR30/90 is higher for a number of reasons: increasing share F segment, loans with skipped hard-rules, technical issues in autocollection, some of the fraud cases issued in Dec24-Feb25, bhr clients with historical overdue>15 days, technical issues with reject for historical overdue>15 days and increasing in the share of lower-quality loans issued through Other in the portfolio, increasing influence of big amount in a long period.
- **September** - is lower due to write-offs.
- **November - January** — Lower origination volumes led to portfolio aging and higher PAR due to limited dilution with new high-quality loans.

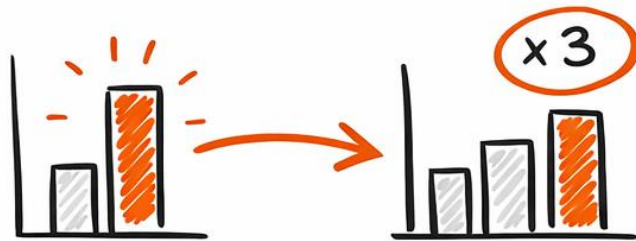

The Goal of Visualization

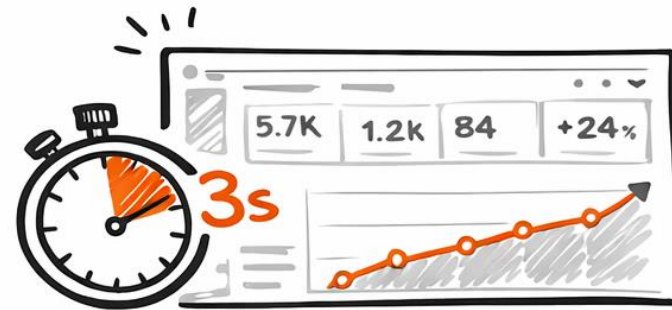

Reduce cognitive effort

Highlight what matters

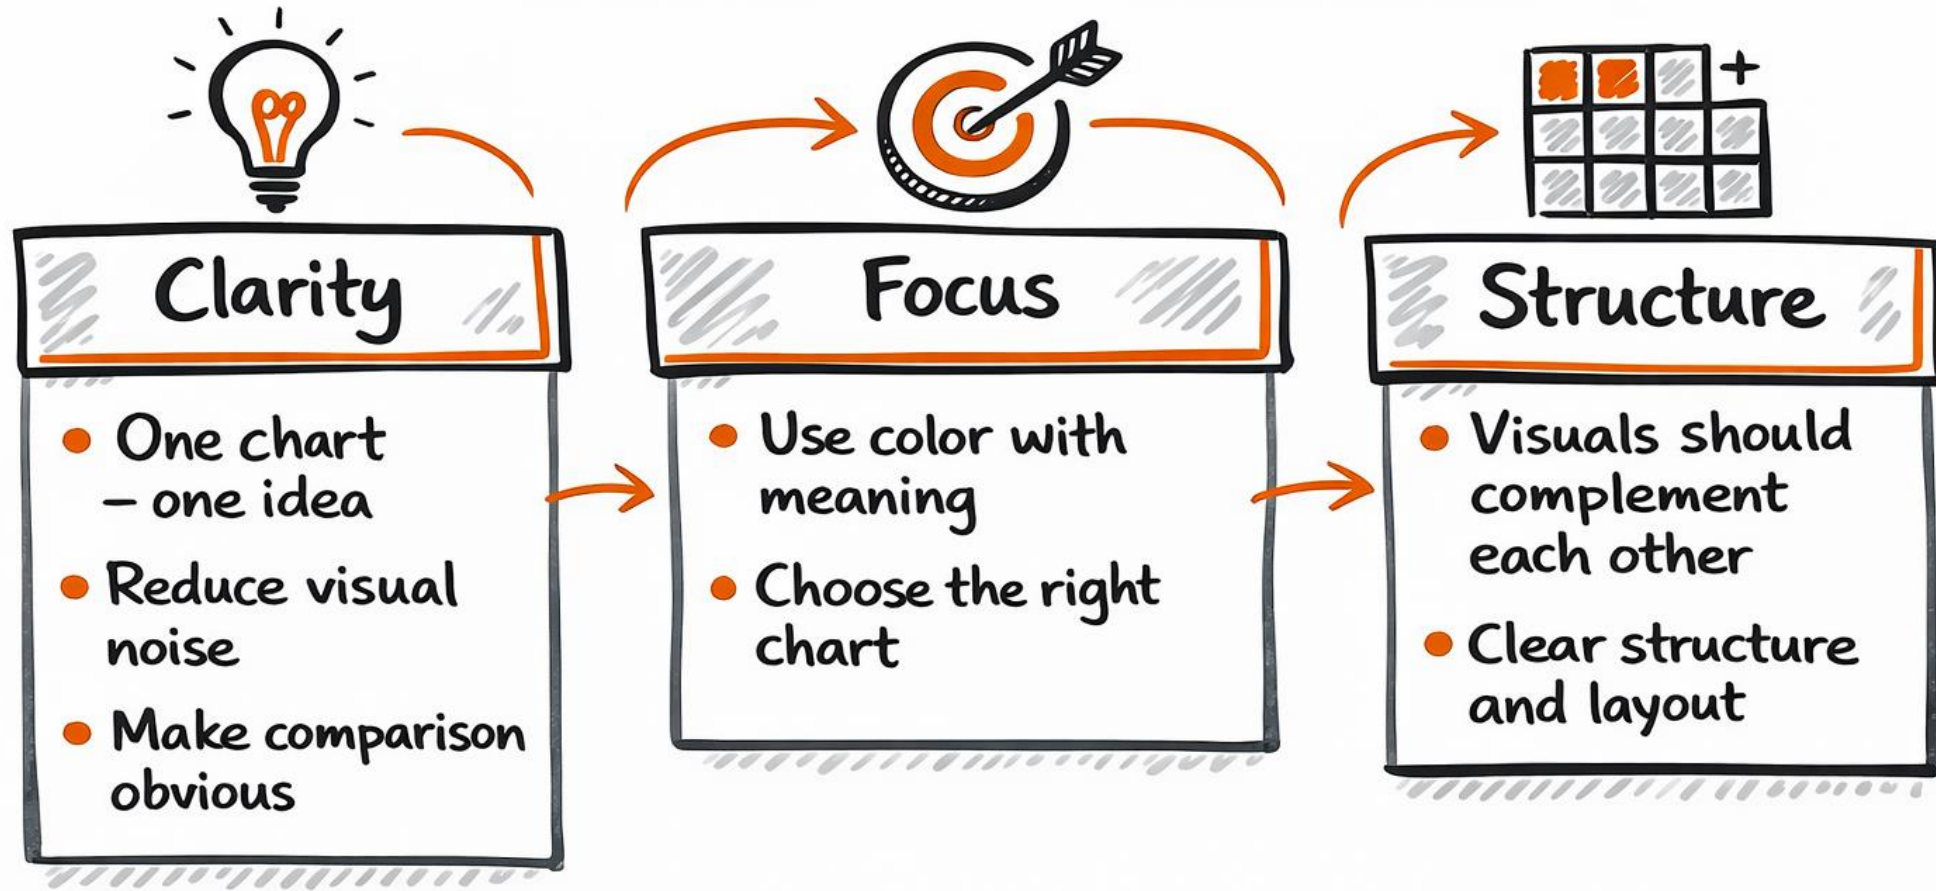

Make comparisons obvious

Clear message in seconds

Principles of Good Visualization

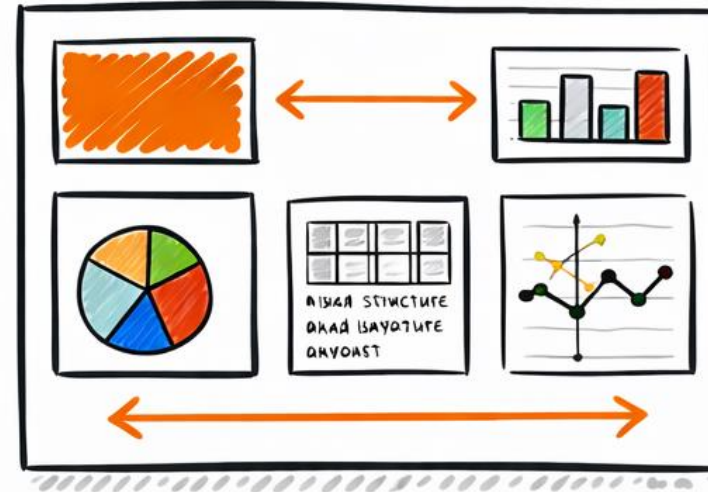

Structure: guide the reading flow

❌ Wrong

No clear reading path

✅ Right

Q & A

Start with a question

Not with a chart

Good visualization is not about charts

It's about making thinking visible

Thank you!
